

practice task #4: business profit

Mary works as a hairdresser and owns her own salon. She wanted some help from you calculating her expenses and revenue for the last year.

instructions

Write a program that reads two integers from the standard input:

- the total amount of expenses of last year (in \$-s),
- the total amount of revenue of last year (in \$-s)

Print the appropriate message the standard output. There are 3 possibilities:

- if the year was profitable, print "profit: <PROFIT>\$"
- if the year was unprofitable, print "loss: <LOSS>\$"
- if the year was neither profitable neither unprofitable, print "barely even"

an example run:

Std. Input:

expenses in last year (\$): 25000

revenue in last year (\$): 30000

Std. Output:

profit (\$): 5000
